Continuation of 11. does NOT place the application in condition for allowance because: the applicant's arguments are not persuasive. The applicant argues that the actuator plays no role in the second mode, since the actuator is not moved in the tamping process and the tamping is performed manually by using a tamping member. It is the examiner's position that Nash discloses the actuator is operable in a first mode (pushing to forward position) for deployment of the inner member and a second mode (retracting) configured for tamping an outer member as claimed. The actuator is moved during the tamping process in that it is retracted as the tamping member is slid down the filament (for example, see column 14, lines 1-3). It is noted that claims 1, 17, and 22 do not require physical contact between the actuator and the sealing member during the tamping process.
